WRITTEN DOCUMENTATION

AI-ASSISTED OJT PORTFOLIO DEVELOPMENT

FORMAL PROJECT REPORT

Course Code & Title	CT 415
Project Name	Personal OJT Portfolio Website
Student Full Name	Jerome Edward Dela Cruz
Student ID	2023100431
Program & Section	Bachelor of Industrial Technology, Major in Computer Technology 4CG1
Instructor Name	Vinna Niña E. Orozco
Active Deployment URL	https://jeromeedwarddc.github.io/ojt-portfolio/
Date of Submission	November 6, 2026

Prepared by Jerome Edward Dela Cruz
Bachelor of Industrial Technology, Major in Computer Technology
Bulacan State University

This report documents the development decisions, AI prompting process, practical challenges, deployment workflow, and learning outcomes from creating a personal portfolio website for OJT preparation.

SECTION 1: DEVELOPER PROFILE & LINKS

Target Industry Track / Role

My target industry track is **Front-End Web Development Intern**, with an additional interest in **UI/UX Integration**. I want to apply my foundation in HTML, CSS, JavaScript, interface layout, and responsive design while learning professional development practices from an experienced team.

Professional Elevator Pitch

I am a Computer Technology student at Bulacan State University with a developing foundation in front-end web development, responsive interface design, and database concepts. I have worked on website redesign and interactive website projects, and I continue to improve my skills through hands-on practice and technical learning. I am seeking an OJT opportunity where I can contribute, learn from a development team, and grow into a dependable web development professional.

Cover Letter

November 6, 2026
Hiring Manager / Recruitment Officer
[Company Name]
[Company Address]

Dear Hiring Manager,

I am writing to express my interest in an On-the-Job Training opportunity at your company, particularly in a role related to front-end web development or UI/UX integration. I am currently taking Bachelor of Industrial Technology, major in Computer Technology, at Bulacan State University. Through my academic activities and personal projects, I have developed an interest in building responsive websites, organizing digital content, and improving user experiences.

My portfolio includes a redesign concept for the Bulacan State University website, an interactive website for CIT student organizations, and a SoloLearn SQL Intermediate

certificate. These works reflect my interest in web design, front-end development, and database fundamentals. I have practiced using HTML, CSS, JavaScript, Figma, Git, and GitHub while developing and publishing my portfolio.

I understand that OJT is an opportunity to apply classroom learning in a professional environment. I am willing to learn, accept feedback, follow workplace standards, and contribute to assigned tasks with responsibility and attention to detail. I would appreciate the opportunity to discuss how my current skills and willingness to improve may support your team.

Thank you for your time and consideration. I look forward to the possibility of completing my industry training with your company.

Respectfully yours,
Jerome Edward Dela Cruz

SECTION 2: TECHNOLOGY STACK & AI TOOLING

1. Coding Environment & Core Stack

Visual Studio Code (VS Code): Used as the coding environment for editing and organizing the portfolio files. The project is separated into HTML, CSS, JavaScript, and asset files.

HTML5: Used to define the page structure and content, including navigation, hero section, developer profile, capabilities, selected project cards, contact information, and footer. The HTML uses semantic elements such as *header*, *nav*, *main*, *section*, *article*, and *footer*.

CSS3: Referenced through the external stylesheet at *assets/css/style.css*. It controls the visual presentation and layout. The portfolio's visual direction includes a dark interface, accent colors, cards, responsive sections, and interactive visual treatments. The stylesheet was not included with the supplied HTML source, so individual CSS rules are not described as verified.

JavaScript: Loaded from *assets/js/main.js* using the *defer* attribute. The HTML contains elements intended for interactive behavior, including mobile navigation, a live clock, reveal effects, work filters, a command palette, toast notifications, and a project quick-view modal.

Browser testing: A web browser is used to preview the published page and check navigation, project links, images, and responsive behavior. Browser Developer Tools can help inspect page elements, console errors, network requests, and viewport sizes. The exact browser version was not specified.

2. AI & Vibe Coding Tools Used

ChatGPT: Used as the primary AI assistant in the development conversations. It helped revise HTML project cards, improve project descriptions, suggest clearer project categories and arrangements, explain GitHub repository setup, and provide guidance for GitHub Pages deployment and documentation. AI-generated suggestions were reviewed and corrected before being treated as final.

The HTML capability list also mentions Claude, Cursor, and GitHub Copilot. However, the available development conversation does not confirm that these tools were actively used to build this portfolio. They are therefore not listed as confirmed

tools used for this project.

3. Deployment Platform

GitHub Pages was selected to publish the static portfolio because it hosts a website directly from a GitHub repository and provides a public deployment URL. The public repository is *ojt-portfolio*, and the active deployment URL supplied for this report is *https://jeromeedwarddc.github.io/ojt-portfolio/*.

The deployment process involved uploading the website files to the repository, keeping the main *index.html* in the repository's root directory, organizing supporting assets into the folders expected by the HTML, and enabling GitHub Pages in the repository settings. Later changes can be committed and pushed to the repository so the published website can be updated.

SECTION 3: PROMPT ENGINEERING STRATEGIES & ITERATION LOG

1. Prompting Strategies Applied

Technique 1: Context-setting with project-specific references

I provided the AI with the existing HTML code together with the actual project name, screenshot, purpose, and the correct Figma or certificate link. This context was important because the original portfolio template contained placeholder project names and descriptions. Supplying the real project details helped the AI replace unrelated content with descriptions that represented my actual work.

> ***Example prompt:*** *"This is Project 3. It is the CIT Organizations interactive website. Use the screenshot and Figma link I provided. Rename the project to 'CIT Org Interactive Web' and write a description explaining that it presents the student organizations of the College of Industrial Technology. Do not describe it as a network setup."*

Technique 2: Iterative prompting and constraint-based editing

I reviewed each response and gave follow-up instructions when the output did not match the project. I also supplied the existing HTML structure so the AI could revise the relevant card without unnecessarily rebuilding the entire page. This helped preserve existing class names and page behavior while correcting titles, descriptions, categories, and links.

> ***Example prompt:*** *"Keep the existing work-card structure and CSS classes. Change the project content to match the actual SQL Intermediate certificate from SoloLearn. Add the certificate image and make the View Certificate link open the official SoloLearn certificate URL."*

2. Prompt Iteration Log: The Before and After

Instance A: Project card content and component mismatch

Initial prompt given: I provided the existing Project 2 HTML card and asked for a better description, certificate image, and link so the item could be included in the portfolio.

Flaw in AI output: The original template described Project 2 as a "Campus Lab Inventory Tracker" dashboard. That content did not match the actual achievement, which was a SoloLearn SQL Intermediate certificate. Keeping the dashboard title, role,

and description would have misrepresented my work.

Corrective follow-up prompt / strategy used: I clarified: “That is not a dashboard. It is a certificate and for SQL Intermediate in SoloLearn. Make a better description.” I then supplied the certificate image and official verification URL. This corrected the project context and gave the AI the right reference material.

Final adjustment: The entry was changed to “SQL Intermediate,” placed under Certifications, and given a certificate-focused description. The View Certificate link points to the official SoloLearn certificate page.

Instance B: Project category and naming did not communicate the work clearly

Initial prompt given: The portfolio filter controls used broad labels such as “Web Interface,” “INTERACTIVE WEBSITE,” and “CERTIFICATE.” I asked for better names and a clearer arrangement for the projects.

Flaw in AI output: The labels were not consistent in wording or level of detail. “Web Interface” could describe design or development, while “Interactive Website” described a project type. The categories needed to be concise, consistent, and easy for recruiters to understand.

Corrective follow-up prompt / strategy used: I asked for better names and clarified that the filter labels should distinguish the actual kinds of work rather than use mixed or unclear terms.

Final adjustment: The filter labels were organized around “All Works,” “Web Design,” “Web Development,” and “Certifications.” These labels help visitors distinguish the BulSU redesign, CIT interactive website, and SQL certificate.

SECTION 4: REAL BOTTLENECKS & PRACTICAL PROBLEM-SOLVING

1. Bottleneck 1: Layout & Mobile View Quirks

A major design challenge was deciding how to present projects with different purposes and image types in one portfolio section. The BulSU redesign is a web-design project, the CIT Organizations page is an interactive website, and the SQL item is a certificate rather than a website screenshot. Treating all three cards identically could make the certificate look like another website project and weaken the visual hierarchy.

I addressed this by separating the project categories and making the BulSU redesign the featured card, while keeping the CIT website and certificate as supporting cards. For mobile review, the important checks are whether cards stack without horizontal overflow, images keep a suitable aspect ratio, text remains readable, and filter and modal controls remain usable. The supplied HTML references an external CSS file, but that CSS file was not included with the source provided for this report. Therefore, a specific mobile CSS defect cannot be confirmed from the HTML alone; the published site should be tested at phone, tablet, and desktop widths.

2. Bottleneck 2: Live Deployment / Asset Loading Issues

During GitHub setup, the repository initially showed uploaded files together in the root directory. This raised an asset-path issue because the HTML expects some files to be stored in specific folders. For example, it references the stylesheet at *assets/css/style.css*, the JavaScript at *assets/js/main.js*, project images under *assets/img/projects/*, the profile image at *assets/img/profile.jpg*, and the résumé at *assets/resume.pdf*. If the files remain in the root or are placed in folders with different names, the browser may not find them at the referenced paths.

I addressed this by learning to create folders in the GitHub repository and place each file in the matching location. I also learned to keep file and folder capitalization consistent because published hosting environments can treat differently capitalized paths as separate names. The repository should be checked against the paths in the HTML, and the live website should be refreshed after GitHub Pages finishes publishing the latest commit.

3. Bottleneck 3: Working with AI-Generated Code

The most difficult part was making sure AI-generated content accurately described the real project instead of retaining assumptions from the original template. The first project-card content included unrelated examples such as an inventory dashboard and a network setup. The AI could improve the wording, but it could not reliably know that those details were wrong unless I supplied the actual project identity, screenshot, and link.

I solved this by reviewing the output, correcting project names and categories, supplying official links, and asking for focused changes while preserving the existing HTML structure. I also had to understand the file paths and GitHub Pages folder structure instead of assuming that generated code would automatically match the repository.

SECTION 5: EXPERIENCE REFLECTION & OJT READINESS

1. Human vs. AI Roles

AI was most useful for producing first drafts, improving descriptions, suggesting clearer labels, revising repeated HTML content, and explaining GitHub Pages procedures. It helped me improve the portfolio's project-card content and understand the deployment steps. However, it was less reliable when the original code contained placeholder information or when the project context was unclear. For example, it initially treated the SQL certificate as a dashboard and the CIT website as a network-related project.

My responsibility was to provide accurate project information, decide which suggestions were appropriate, check that the code preserved the existing structure, verify links and image paths, and test the published website. AI supported the process, but I made the final decisions and corrections.

2. OJT Industry Readiness

The Selected Work section is the strongest part of my portfolio for demonstrating OJT readiness. It presents two website projects with different purposes: the BulSU Website Redesign demonstrates my interest in website layout, content organization, and user experience, while CIT Org Interactive Web demonstrates my ability to plan an interactive website for a defined audience. The SQL Intermediate certificate also shows that I am continuing to build knowledge beyond front-end topics.

The About and Capabilities sections further support this by identifying my Computer Technology background and listing my current skills, including HTML5, CSS3, JavaScript fundamentals, responsive design, Git/GitHub, and technical troubleshooting. These sections give recruiters a quick overview of my interests and current learning direction.

3. Future Upgrades

Before sending the portfolio to companies, I plan to add a detailed case-study page for each major website project. Each case study will include the project objective, target users, my exact responsibilities, design decisions, screenshots, technologies used, development challenges, and the final result. This would help recruiters understand not only what each project looks like, but also how I approached the work and what I personally contributed.

I also plan to replace any remaining placeholder social links in the HTML with my real public profiles. This is an important final check because the supplied source includes placeholder GitHub and LinkedIn destinations in some sections. All contact and project links should be tested before the portfolio is sent to recruiters.

Submission reminder: Replace the company name and address in the cover letter with the intended OJT company before sending the portfolio documentation to your instructor or a recruiter.
